## Review

Describe the end behavior using limits:
$f(x)=2^{-3 x}$
$f(x)=.85^{-x}$

### 3.2 Exponential Modeling

What is the initial value and percent of increase or decrease?
$f(x)=52 \cdot 1.15^{x}$
$f(x)=5 \cdot .85^{x}$

$$
f(x)=a_{0} \cdot b^{x}
$$

$$
f(x)=a_{0} \cdot(1 \pm r)^{x} \quad \begin{aligned}
& \text { increase or decrease - the } \\
& \text { base is expressed as }
\end{aligned}
$$

$$
\text { base is expressed as } 100 \%
$$

+ or - the \% change.
$f(x)=2 \cdot .73^{x}$
Is this an increase or decrease?

By what \%?

The initial value is 4 and the population is increasing by $3 \%$. Write an exponential equation.

When will the population reach 10 ?

> If you have the life cycle of a given behavior then use this formula.

A the amount after a given period of time $a_{0}$ the initial amount
$t$ time
n the life cycle of the behavior
b type of behavior (doubling, half life, etc.)

You have 5 grams of a substance that has a half life of 20 days.
$A=a_{0} \bullet(b)^{\frac{t}{n}} \quad \begin{aligned} & \text { How mu } \\ & 15 \text { days? }\end{aligned}$
When will you have less than 2 grams?

## Exponential Regression

A process of fitting a set of data to an exponential equation.
